

# Northwest Territories Ice Jam Flood Mapping Guidelines V1.0

Jad Saade

Dan Healy

Hydrologist

Principal

**GNWT** 

NHC

### **Overview**

- Need for ice jam flood mapping guidelines [presented by Jad]
  - Ice jam flooding and flood mapping in NWT
- Ice Jam Flood Mapping Guidelines V1.0 [presented by Dan]
  - Workflow and highlights

### Need for ice jam flood mapping guidelines

• **Ice jams** are accumulations of ice in a river that can lead to flooding. They are a natural part of winter river processes. Ice jams form when the ice

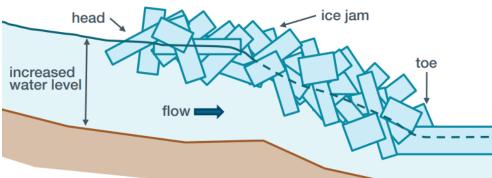

Alberta

Freedom To Create, Spirit To Achieve.

rise.

blocks the river flow, causing the water level to

- "While the ice jams themselves are more impressive in the Northwest, with the large rivers and thick ice, .... Ice jams have been a feature of Canadian life from the beginning." (Beltaos, 1995)
- Guidance was lacking, no standard Canadian ice jam flood mapping guideline.

### Need for ice jam flood mapping guidelines

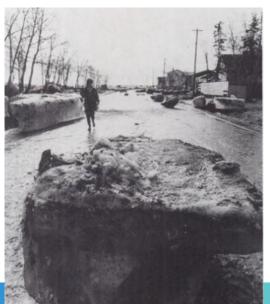

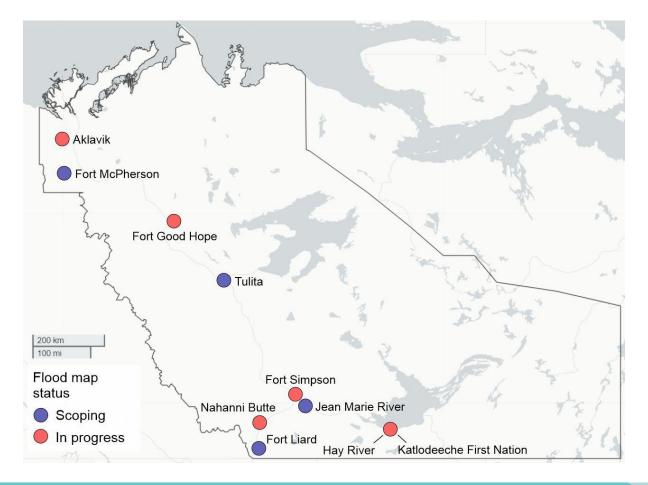

- Historically, ice jam flooding being major flood mechanism in the NWT.
- Significant cost and damage on communities and infrastructure.

• Ice Behavior - River ice regime/dynamics is a complicated field

of science.

Liard-Mackenzie Confluence at Fort Simpson, NWT (Edmonton Journal, 1989)

### **History of flood mapping in NWT**

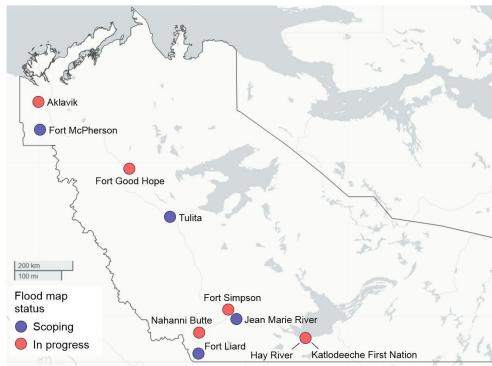

No Federal or Territorial Mapping

### Federal mapping programs

FDRP – Flood Damage Reduction Program
FHIMP – Flood Hazard Identification and Mapping Program

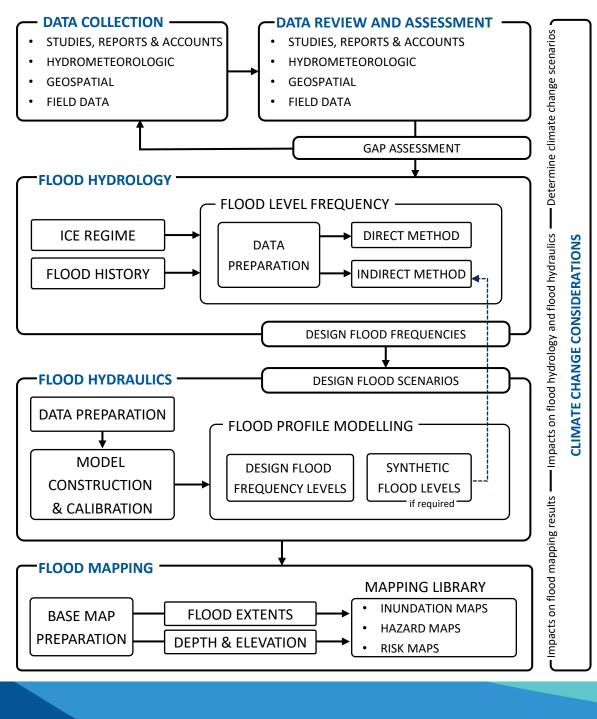

### Ice jam flood mapping guidelines V1.0

- Intended to inform on best practices for developing engineered flood hazard maps where ice jam flooding is the dominant flood mechanism.
- Complementary to the Federal Flood Mapping Guideline Series (FFMGS)
  - Program framework
  - LiDAR data acquisition
  - Hydrologic and hydraulic procedures
  - Geomatics
  - Flood damage estimation
  - Climate change
  - Bibliography and references for flood mitigation
- Evergreen

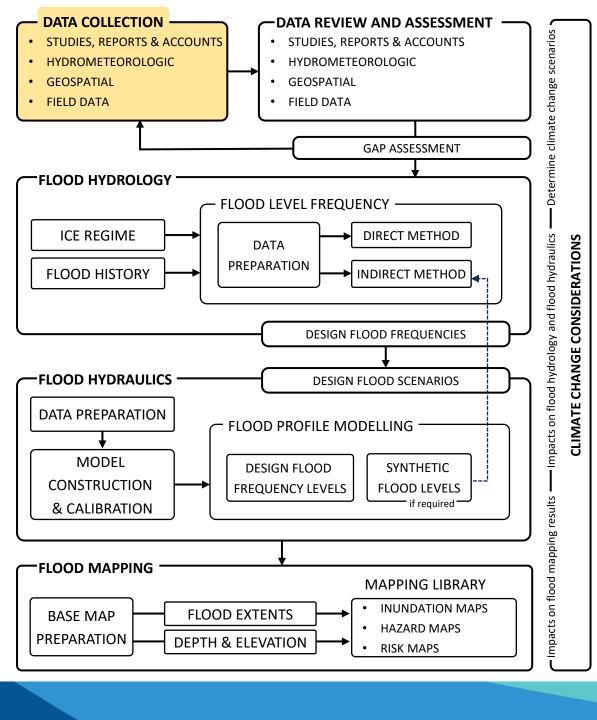

### Methodology overview

- Data collection
- Data review and assessment
- Flood hydrology
- Flood hydraulics
- Flood mapping
- Climate change considerations

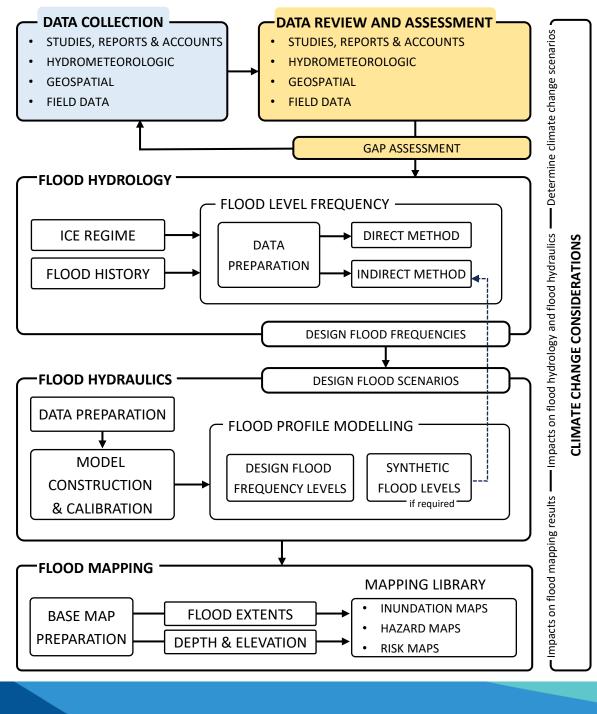

### **Data Collection**

- Studies, reports, and accounts
- Hydrometeorologic
- Geospatial
  - Including Lidar acquisition
- Field data
  - Including survey program

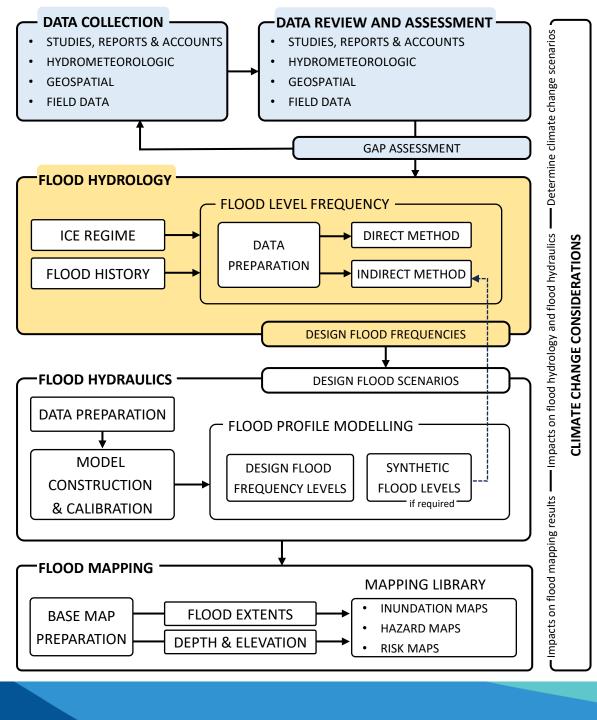

# Data Review and Assessment

- Review and assess studies, reports, accounts, hydrometric, geospatial, and field data.
- GAP ASSESSMENT
  - Assess adequacy of data to fulfill project requirements
  - Evaluate need to collect additional data
  - Develop methods for working with limited data

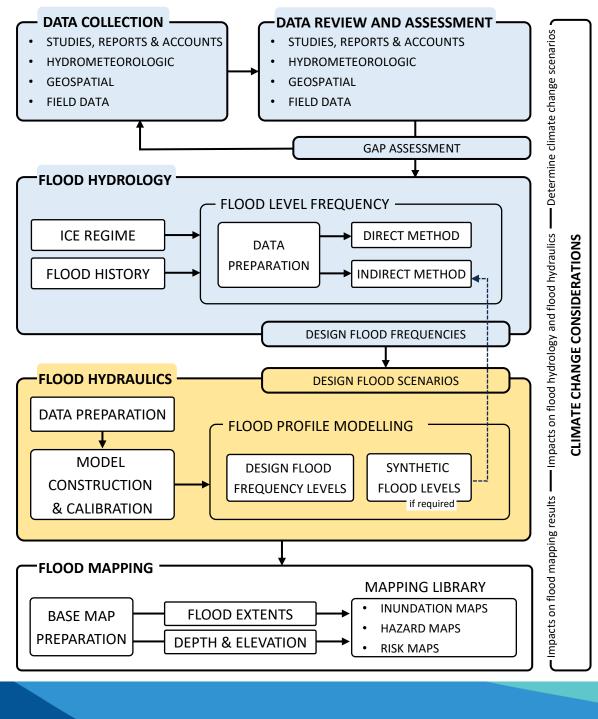

### **Flood Hydrology**

- Ice regime
- Flood history
- Flood level frequency
  - Data preparation
  - DIRECT or INDIRECT METHODS
- Design flood frequencies

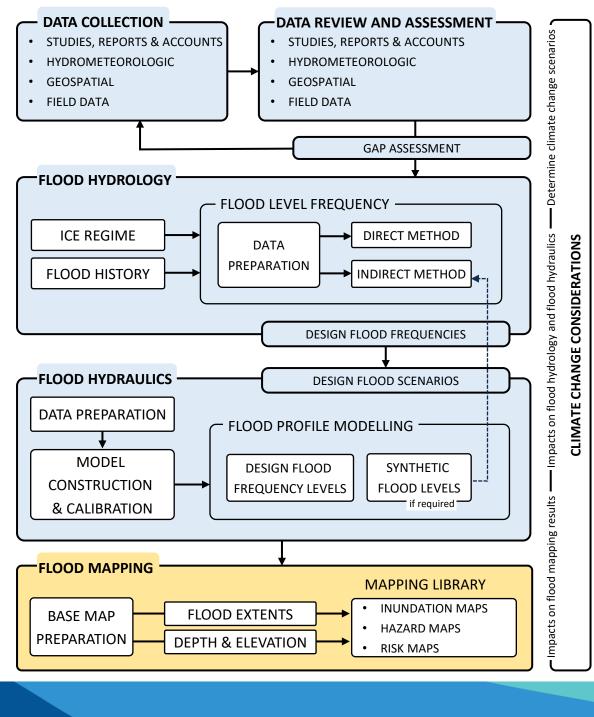

### **Flood Hydraulics**

- Design scenarios
- Data preparation
- Model development
- Model implementation
- (Feedback to flood hydrology)
- Design flood levels feed into the mapping

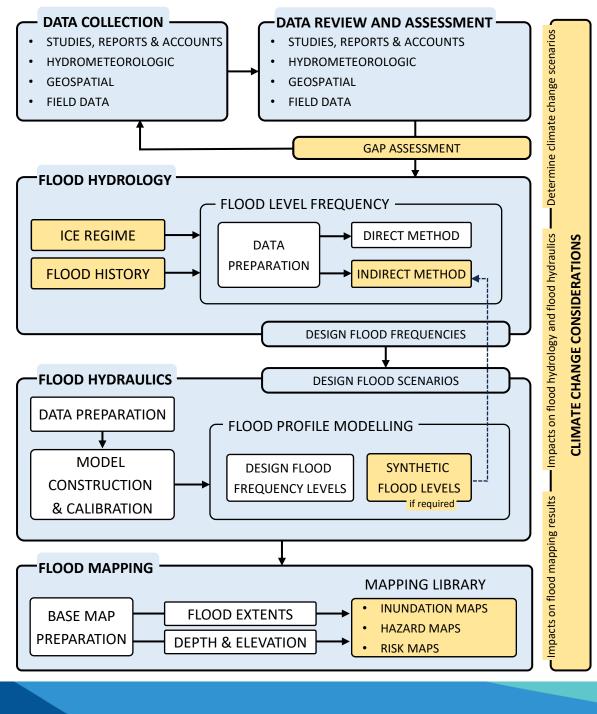

### **Flood Mapping**

- Base mapping
- Flood extents, depth, and elevation
  - Flood elevation surface
  - Flood elevation grid
  - Flood depth grid
  - Inundation extent
- Manual edits
- Map library
  - Inundation, hazard, risk maps

# **Climate Change Considerations**

- Integrated throughout the workflow
  - Climate scenarios
  - Impacts on hydrology and hydraulics
  - Impacts on flood mapping
- Assessment is informed by the various study components

### It is a guideline

- A guide to inform the project management team and technical experts
- As with any flood study you require a team with specialist expertise
  - Survey and geomatics
  - Flood hydrology
  - Flood hydraulics
  - Flood mapping
  - River ice

### Thank you

<ul> <li>Dominant ice jam processes</li> </ul>	Periods of record	Survey data comparison	• QA/QC	
<ul> <li>Confirm ice jam is dominant</li> </ul>	Representative events	Conventions and symbology	Bathymetry / bed survey	
flood mechanism (over open water)	Representative of study reach	Preliminary base maps and	Hydraulic structures	
water)		geodatabase	Flood control structures	
			Field notes, photos, and video	

### **GAP ASSESSMENT**

- Assess adequacy of data collected for hydrology, hydraulics, and mapping.
- Assess the need to pursue collection of additional data that was identified during the data review (e.g., other published work, work in progress, additional local knowledge).
- Assess the need to collect additional monitoring, observational, or survey data.
- Develop methodology to rely on limited data.

## Methodology – Companion Tables FLOOD HYDROLOGY

### **FLOOD HYDROLOGY**

### **FLOOD HISTORY**

- Overview of ice jam flood history and locations prone to flooding.
- Tabulated historical and observed ice-affected floods (dates, location, magnitude, and impacts).
- Detailed summary of major documented events with supporting information including:
- Sequence of events leading to the evolution of the ice jam flood event.
- Description of the ice jam development, the maximum flood condition, and ice jam recession.
- Information collected during the event including survey data and ground observations (e.g., water level profiles, photos, ice conditions), and aerial observations by plane, helicopter, and/or drone (e.g., river reach extent and nature of ice conditions).
- Post event information including survey data (e.g., highwater mark profiles, ice scars, shear walls), monitoring data (e.g., water levels), post processed data (satellite data, aerial imagery, ice mapping).

# Methodology – Companion Tables FLOOD HYDROLOGY

### **FLOOD HYDROLOGY**

#### **ICE REGIME**

- Identify hydro-climatic conditions characteristic to the study reach.
- Examine river morphology and identify locations of interest with respect to ice processes including hydraulic controls, steep sections, deep pools, sharp bends, geomorphic features, river encroachments.
- Characterize various ice processes in relation to the study reach.
- Determine causal factors for ice jam severity.
- Determine typical ice characteristics (thickness, roughness, type).

# DATA PREPARATION • Hydrometric records • Measured data (highwater marks, trees scars) • Model input data (where synthesized data is included) DIRECT METHODS • Extreme value statistics • Frequency analysis • Modelling and data synthesis • Frequency analysis

# **Methodology – Companion Tables FLOOD HYDRAULICS**

FLOOD HYDRAULICS					
<ul> <li>DATA PREPARATION</li> <li>River geometry</li> <li>Physical jam characteristics</li> <li>Calibration data</li> <li>Boundary conditions</li> </ul>	MODEL CONSTRUCTION & CALIBRATION  • Model geometry  • Jam stability parameters  • Roughness  • Calibration	FLOOD PROFILI SYNTHETIC FLOOD LEVELS  • Calculate flood levels to support frequency analysis (if required)	FLOOD FREQUENCY LEVELS		

# **Methodology – Companion Tables FLOOD MAPPING**

FLOOD MAPPING					
<ul> <li>BASE MAP PREPARATION</li> <li>Layout and scale</li> <li>Base data</li> <li>Model information</li> <li>Annotation</li> <li>Symbology</li> </ul>	<ul> <li>FLOOD EXTENTS (VECTOR DATA)</li> <li>Flood extents derived from flood profiles</li> <li>Refinements / adjustments</li> </ul>	DEPTH AND ELEVATION (RASTERIZED DATA)  • Create water surface elevation and depth grids	<ul><li>MAP LIBRARY CREATION</li><li>Inundation maps</li><li>Hazard maps</li><li>Risk maps</li></ul>		

# Methodology – Companion Tables CLIMATE CHANGE CONSIDERATIONS

### **CLIMATE CHANGE CONSIDERATIONS**

- Determine climate change scenarios.
- Assess potential impacts of climate change scenarios on flood hydrology and flood hydraulics.
- Assess potential impacts of climate change scenarios on flood mapping results.
